

Ziv Behar

Sunnyvale, CA | (408) 338-7640 | ziv_behar@berkeley.edu | [linkedin.com/in/ziv-behar](https://www.linkedin.com/in/ziv-behar) | zivbehar.vercel.app | <https://github.com/zivbeh>

Education - University of California, Berkeley

May 2027

B.S. Electrical Engineering and Computer Science (Honors) | *College of Engineering*

GPA: 3.97/4.0

Research

Liwei Lin Lab (BSAC) – Undergraduate Researcher

Jan 2025 - Present

- Implemented and optimized the FISTA compressed sensing reconstruction algorithm to achieve sub-millimeter accuracy from noisy signal data, supported by custom benchmarking and visualization.
- Built microcontroller firmware for ultrasonic pulse transmission and signal acquisition, and implemented a genetic algorithm to optimize drive parameters and reduce pulse ringdown by over 90%.
- Designed and tested custom PCBs in KiCad, consolidating 8 discrete electrical components into a single 30x10cm board, integrating PMUTs to drive ultrasonic signals for 3D robotic imaging.

Work Experience

LIFTR getliftr.com – Machine Learning Engineer & iOS Developer

Nov 2025 - Present

- Shipped an iOS fitness coaching app running on-device ML vision inference, serving real users.
- Derived structured form feedback by analyzing real-time pose signals at 30 FPS on mobile hardware, transforming raw model outputs into personalized coaching cues.
- Developed a distinct LSTM-based workout recommendation engine that retrains incrementally as users log workouts, adapting recommendations over time while preserving privacy and zero network latency.
- Stack: CoreML, Swift/SwiftUI, PyTorch, Firebase, Superwall.

Projects

SnapSort

Jan 2025 - Dec 2025

- Built a transformer-based event clustering system for large-scale personal photo datasets, optimized for accuracy and inference throughput.
- Designed a reproducible data ingestion and labeling pipeline to construct a high-quality event dataset from noisy, unstructured photo streams.
- Created a mobile ↔ cloud ML pipeline for embedding generation, clustering, and high-dimensional vector search, leveraging GPU-accelerated inference and vector indexing.
- Implemented custom gRPC services and parallelized inference pipelines to reduce end-to-end query latency and sustain high throughput.
- Stack: Python, PyTorch, Node JS, React Native, gRPC, Playwright, FAISS.

MoffittStatus

Sep 2024 - Jan 2025

- Launched a campus-scale system serving real-time seat occupancy across multiple libraries and floors at UC Berkeley, helping thousands of students find open seating faster.
- Built the full stack: data ingestion, processing, APIs, front-end. Eventually turned messy WiFi traffic sensor data into actionable feedback and deployed REST APIs to stream occupancy state.
- Reached 3.5k active users within a month, with over 200k views on our Instagram.
- Acquired by the ASUC (UC Berkeley Student Union) to continue development.

Skills

Languages: Python, Java, JavaScript/TypeScript, C++, RISC-V, Swift, SQL.

Frameworks: PyTorch, CoreML, React/React Native, AWS, gRPC, Playwright, Logism, LTspice, KiCAD.
