

Ziv Behar

Sunnyvale, CA | (408) 338-7640 | ziv_behar@berkeley.edu | [linkedin.com/in/ziv-behar](https://www.linkedin.com/in/ziv-behar) | zivbehar.vercel.app | <https://github.com/zivbeh>

Education - University of California, Berkeley

May 2027

B.S. Electrical Engineering and Computer Science (Honors) | *College of Engineering*

GPA: 3.97/4.0

Relevant Coursework: Efficient Data Structures & Algorithms, Advanced Computer Architecture, Machine Learning, Compilers, Linear Alg, Discrete Math, Devices and Systems, Microelectronic devices, CCNA.

Work Experience

LIFTR getliftr.com – *Co-founder and Lead Developer*

Nov 2025 - Present

- Shipped a revenue-generating iOS app running on-device ML inference, serving real users under strict latency and size constraints.
- Derived structured form feedback by analyzing real-time pose signals at 30 FPS on mobile hardware, transforming raw model outputs into personalized coaching cues.
- Developed a distinct LSTM-based workout recommendation engine that retrains incrementally as users log workouts, adapting recommendations over time while preserving privacy and zero network latency.
- Stack: CoreML, Swift/SwiftUI, PyTorch, Firebase, Superwall.

MoffittStatus (acquired by ASUC) – *Co-founder and Lead Developer*

Sep 2024 - Jan 2025

- Launched a campus-scale system serving real-time seat occupancy across multiple libraries and floors at UC Berkeley, helping thousands of students to find open seating faster.
- Built the full stack: data ingestion + processing + APIs + front-end; turned messy WiFi traffic sensor data into actionable feedback and deployed REST APIs to stream occupancy state.
- Reached 3.5k active users in month 1 with 30% WoW growth. 200K+ Views on our Instagram.
- Acquired by the ASUC (UC Berkeley Student Union) and accepted to SkyDeck Pad-13 program.

Projects

SnapSort

Jan 2025 - Dec 2025

- Built a transformer-based event clustering system for large-scale personal photo datasets, optimized for accuracy and inference throughput.
- Designed a reproducible data ingestion and labeling pipeline to construct a high-quality event dataset from noisy, unstructured photo streams.
- Created a mobile ↔ cloud ML pipeline for embedding generation, clustering, and high-dimensional vector search, leveraging GPU-accelerated inference and vector indexing.
- Implemented custom gRPC services and parallelized inference pipelines to reduce end-to-end query latency and sustain high throughput.
- Stack: Python, PyTorch, Node JS, React Native, gRPC, Playwright, FAISS.

Balloons Pop zivbeh.github.io/BalloonsPOP/

October 2023 - July 2024

- Built a high-FPS HTML Canvas tower-defense game, optimizing real-time simulation and rendering to sustain smooth gameplay under large object counts and dense wave interactions.
- Designed modular, data-driven systems for unit upgrades, pathing, and wave scripting, enabling rapid content scaling without changes to core game logic.

Skills

Languages: Python, Java, JavaScript/TypeScript, C++, RISC-V, Swift, SQL.

Frameworks: PyTorch, CoreML, React/React Native, AWS, gRPC, Playwright, Logism, LTspice, Git.
